

# Cloud Spotting

Watching clouds is something that can be done anywhere, you can sit in the park, on the beach or even just look out your window. Here are some of the different types of clouds you can look out for

## Cirrus Clouds

Cirrus clouds are wispy and hair-like, and are found very high up. They are often seen when it is sunnier, and can be bright white during the day.

## Nimbostratus Clouds

Nimbostratus clouds are thick, dark clouds which will completely block out the sun. They have no particular features, and are relatively low in the atmosphere.

## Cumulus Clouds

Cumulus clouds are individual, and detached and can look like little cauliflowers. They can often be whiter at the top then greyer towards the bottom.

## Stratus Clouds

Stratus clouds are very low lying, and are what make up mist and fog. They are fairly grey/white and uniform throughout, and also can form light rain.

# Cloud Spotting

Watching clouds is something that can be done anywhere, you can sit in the park, on the beach or even just look out your window. You can also look to see if the clouds look like any other shapes. Maybe you see a dog, or a dragon or maybe a heart. Here is a space for you to draw the clouds you can see, especially any cool shapes! Also have a go at identifying the clouds you see.
