

Cornflour Experiment

What do you need?

- Cornflour
- Water
- Bowl
- Spoon
- Food colouring (optional, but use with caution!)

What to do?

- First you want to put some cornflour into a bowl. You can use as much as you want for this experiment, ideally at least a cup will work best.
- If you are using food colouring, add a few drops now (we used a drop of blue food colouring)
- Then slowly add in the water. If it is getting too tricky to mix, try making slower movements.
- Keep going until it kind of feels and looks like custard.
- Now, try running your fingers through it. What happens if you move your hand slowly through it? Is it different if you move fast? What if you poke it or try and pick it up?
